

Project 4 Documentation

Description:

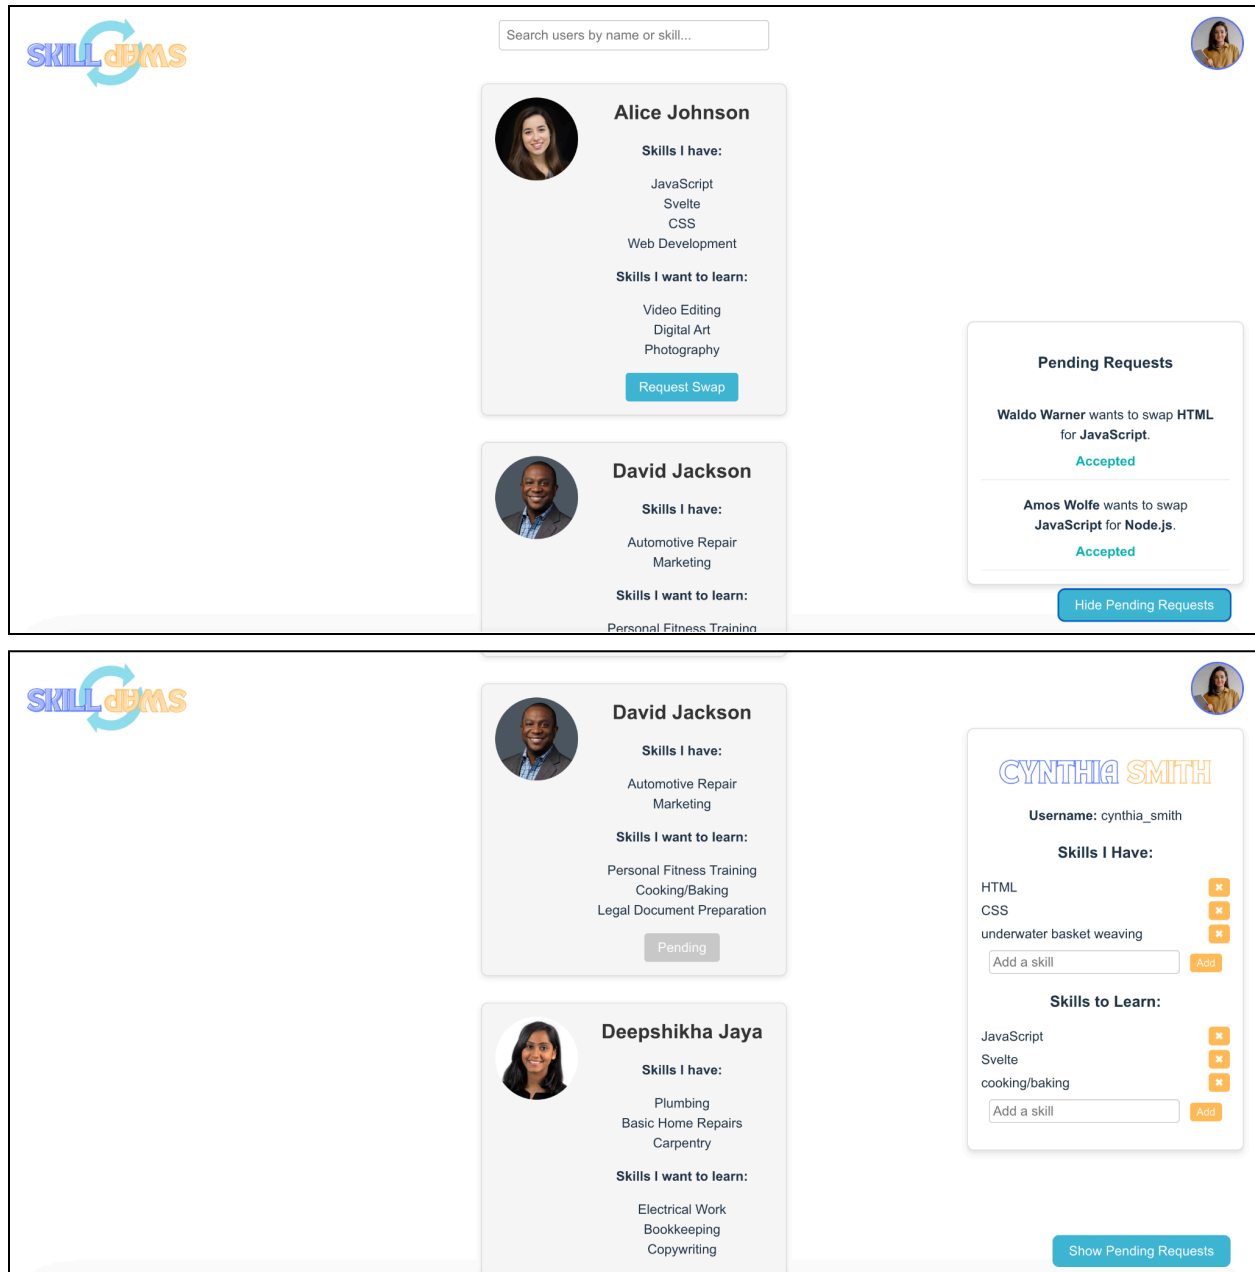

For this project I chose to make the website SkillSwap. This website helps people that don't have enough money to pay for services so instead you can swap skills. For an example, if I am really good at woodworking I could make someone a table in exchange for them making me a pottery sculpture. Another example could be languages so in the case that I am very fluent in German I could teach someone German in exchange for them teaching me Japanese. The list of skills that you can swap is up to you and your imagination.

UI Sketches:

UI Screenshots:

Feature Discussion:

I added the ability for the user to click on the right top profile picture and they can edit their own skills that they have to offer and skills that they are hoping to gain. In the middle of the screen we can see the other users profiles and the various skills that they have and skills that they are also hoping to learn. On top of that there is a search bar at the top for users to search by skills and users. Finally on the bottom right there is a show pending requests button that pulls up a menu for a user to select what requests they want to accept and reject.

Future Changes:

In the future, I think it would be cool to create a chat or video feature for users to be able to interact with each other on the website. I love the idea of also putting a text box for users to make a request to swap skills that might not be on their profile or get more detailed information on what type of swap could be made. I wish I also would have made the user boxes go across the page instead of being lined down the middle.
